

FRAMED* is designed by Yugo Nakamura. He is a web designer and also known as ActionScript artist. His generative arts are based on minimalism. In the first version of FRAMED, the generative art in frame doesn't change.

So, a generative art is changing in frame, but it doesn't change its identity. However, from FRAMED* 2.0, users can change generative art through App.

FRAMED can include any context by users. So users can upload anything they want to display on the wall, like artist's portfolio. Also, users can interact with a frame directly.

I think putting generative arts on real life is really good idea. Usually we can find generative arts mostly in art museum. Also, way to interact with frame is also interesting way. FRAMED uses a camera module to recognize user and users can grab and slide to move to next screen(left photos). As a fan of Yugo Nakamura, I am really interested in his creativity to design easy and popular generative arts to invite people who even don't know anything about generative arts.
